Weekly Report 5
Senior Project

This week I focused on advancing forward with the thesis. I have written the majority of the Functional Requirements section and I am starting working on the Design section, although I will have a lot to write about there. I am also planning on rework the intro section, since, through working on the project, I have a more developed understanding of what I am doing and why.

Additionally, this week I have added all the simple algorithms — I have completed the exposure, contrast, highlights and shadows sliders, and they are all fully functional. Although their scaling can (and probably should be changed) that is purely a cosmetic change that I will not bother with now. I have also finished the downscaling algorithms, and they are both fully functinoal and the user can select whichever one they prefer to use. I need to put in a lot more work on optimizing how these slider and algorithms work, but that will come once I am fully done with the version control data structure. I have started to work on that, but I haven't fully implemented it yet.

Next week, I will be spending most of the time on writing the thesis and getting that ready for the midterm submission. Currently I am up to 11 pages, and I will get that to about 20 this week. Additionally, I am going to start fully implementing the data structure and integrating it into the other parts of the code. That will push me to being quite far into the implementatino of the project, with the only heavy lifting left for the smart select feature.
