Weekly Report 3

This week, I have mostly finalized the general class structure. Additionally, I have now started working on the algorithms — I have finished on the exposure algorithm and I have started implementing that with the GUI, and I have also started working on a function that refreshes the image. I have also finalized the conversion algorithm that takes the png/jpg/ whatever image format, translates it to QImage, through the GUI library I am using, Qt, and from that, I take the information and translate it into my own Image object. This allows me to alter that image.

For next week, I have a pretty lengthy TODO list:

*TODO

- * -> move all the function implementations to .cpp file, don't leave them in .h
 - 1. add a deep copy for Image
 - 2. add a slider to change the exposure value - added
 - 3. start working on the image version graph
 - 4. add a refresh function, which refreshes the image every time a change is made (i.e. the slider is moved)
 - 5. add a way to export the image at the end
 - 6. start thinking about optimizing all the functions, most just have a $O(n^2)$
 - 7. Work on the other easier algorithms — i.e. highlights, shadows and contrast
- */

If everything goes to plan, I will have finished with the easier algorithms, and will have started working on the version graph. I also need to keep writing to the thesis.
