Senior Project Weekly Report

During this week, I have been very focused on writing the report, taking into consideration the feedback given from my advisor, and continuing with writing the adjustment algorithm section. Since time is running out rather quickly, I am planning on focusing heavily on the thesis and when I am at a safe length with that, I will continue adding to the code.

Currently, I am up to 25 pages, and there is still a lot I can and have to write about, including the Adjustment algorithms, the data strucutre, and I have a lot to write about the implementation of all of the algorithms and the data structure.

Time is running out quickly, and I am getting more stressed as it starts running out, but I feel like the application is at a relatively safe position — most of the large algorithms have been successfully implemented, and there is only fine tuning and one major algorithm to implement.
