Senior Project Weekly Report 27/09/2026 - Week 2

This week, I have slowly started the implementation — I chose a GUI library to use, that being Qt, which seems perfect for the topic. Additionally, I have sort of finalized my ideas for the algorithms I want to implement:

- catmul spline adjustment curve that will be responsible for exposure, highlights, shadows and contrast.
- content aware local adjustments — i.e. apply this adjustment only to the background/sky or whatever
- gaussian blur brush

Additionally, I have started writing the thesis, with the intro section, focusing on the motivation for the project and the introduction to the topic. This will obviously undergo editing, but it is a start.

Finally, in starting the implementation: I have started the foundation of the project — I have created the basic 'app' using the qt library, and have started on figuring out the class structure that I will be using. The three main classes I will use are: Pixel, Image, and Filter (this one being the features/algorithm applied over the image).

For next week, as I have already started, I will finalise the ability to import images — that means using Qt's decoder of image formats, like jpeg and png, and saving that into my own image class. Once I am finished with the fundamental class structure, I will start on the implementation of the first algorithms — the adjustment curve.
